```
#include <iostream>
using namespace std;

const int MAX_SIZE = 10;

Byoid powerset(char S[], int n) {
    int totalSubsets = 1<</li>
    int totalSubsets = 1
    int totalSubsets = 1
    int totalSubsets; i++)

{
    cout << "(";

    cout << "(";

    int i = 0; i < totalSubsets; i++)

{
    cout << "(";

    if (i & (1 < j))

    if (i &
```

設置一個變數totalSubsets儲存{a,b,c}共會有多少種組合(2^n),組合可列為000~111,把000~111看成哪項為1時輸出哪項(ex:011,輸出{bc})
